## Character Encoding

CS 8: Introduction to Computer Science, Winter 2019
Lecture \#14
Ziad Matni, Ph.D.
Dept. of Computer Science, UCSB

## Administrative

- LAST HOMEWORK! Hw08: Due Wednesday 3/13
- It's a short one
- Hw07: Due Monday 3/11
- Lab07: Due Monday 3/11
- Project1: Due Thursday 3/14

## Lecture Outline

- ASCII Codes, UTF Codes
- Functions ord() and chr()
- Exercises

## ASCII TABLE

| Decimal | Hex | Char | Decimal | Hex | Char | Decimal | Hex | Char | Decimal | Hex | Char |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | [NULL] | 32 | 20 | [SPACE] | 64 | 40 | © | 96 | 60 | * |
| 1 | 1 | [START OF HEADING] | 33 | 21 | ! | 65 | 41 | A | 97 | 61 | a |
| 2 | 2 | [START OF TEXT] | 34 | 22 | " | 66 | 42 | B | 98 | 62 | b |
| 3 | 3 | [END OF TEXT] | 35 | 23 | \# | 67 | 43 | C | 99 | 63 | c |
| 4 | 4 | [END OF TRANSMISSION] | 36 | 24 | \$ | 68 | 44 | D | 100 | 64 | d |
| 5 | 5 | [ENQUIRY] | 37 | 25 | \% | 69 | 45 | E | 101 | 65 | e |
| 6 | 6 | [ACKNOWLEDGE] | 38 | 26 | \& | 70 | 46 | F | 102 | 66 | $f$ |
| 7 | 7 | [BELL] | 39 | 27 | ' | 71 | 47 | G | 103 | 67 | g |
| 8 | 8 | [BACKSPACE] | 40 | 28 | 1 | 72 | 48 | H | 104 | 68 | h |
| 9 | 9 | [HORIZONTAL TAB] | 41 | 29 | ) | 73 | 49 | 1 | 105 | 69 | , |
| 10 | A | [LINE FEED] | 42 | 2A | * | 74 | 4A | J | 106 | 6 A | j |
| 11 | B | [VERTICAL TAB] | 43 | 2B | + | 75 | 4B | K | 107 | 6B | k |
| 12 | C | [FORM FEED] | 44 | 2C | , | 76 | 4C | L | 108 | 6C | I |
| 13 | D | [CARRIAGE RETURN] | 45 | 2D | - | 77 | 4D | M | 109 | 6D | m |
| 14 | E | [SHIFT OUT] | 46 | 2E | . | 78 | 4E | N | 110 | 6E | n |
| 15 | F | [SHIFT IN] | 47 | 2F | 1 | 79 | 4F | 0 | 111 | 6F | 0 |
| 16 | 10 | [DATA LINK ESCAPE] | 48 | 30 | 0 | 80 | 50 | P | 112 | 70 | p |
| 17 | 11 | [DEVICE CONTROL 1] | 49 | 31 | 1 | 81 | 51 | Q | 113 | 71 | q |
| 18 | 12 | [DEVICE CONTROL 2] | 50 | 32 | 2 | 82 | 52 | R | 114 | 72 | r |
| 19 | 13 | [DEVICE CONTROL 3] | 51 | 33 | 3 | 83 | 53 | S | 115 | 73 | S |
| 20 | 14 | [DEVICE CONTROL 4] | 52 | 34 | 4 | 84 | 54 | T | 116 | 74 | t |
| 21 | 15 | [NEGATIVE ACKNOWLEDGE] | 53 | 35 | 5 | 85 | 55 | U | 117 | 75 | u |
| 22 | 16 | [SYNCHRONOUS IDLE] | 54 | 36 | 6 | 86 | 56 | V | 118 | 76 | v |
| 23 | 17 | [ENG OF TRANS. BLOCK] | 55 | 37 | 7 | 87 | 57 | W | 119 | 77 | w |
| 24 | 18 | [CANCEL] | 56 | 38 | 8 | 88 | 58 | X | 120 | 78 | x |
| 25 | 19 | [END OF MEDIUM] | 57 | 39 | 9 | 89 | 59 | Y | 121 | 79 | y |
| 26 | 1A | [SUBSTITUTE] | 58 | 3A | : | 90 | 5A | Z | 122 | 7A | $z$ |
| 27 | 1B | [ESCAPE] | 59 | 3B | ; | 91 | 5B | [ | 123 | 7B | \{ |
| 28 | 1 C | [FILE SEPARATOR] | 60 | 3 C | $<$ | 92 | 5C | 1 | 124 | 7 C |  |
| 29 | 1D | [GROUP SEPARATOR] | 61 | 3D | = | 93 | 5D | ] | 125 | 7D | \} |
| 30 | 1E | [RECORD SEPARATOR] | 62 | 3E | $>$ | 94 | 5E | $\cdots$ | 126 | 7E | $\sim$ |
| 31 | 1 F | [UNIT SEPARATOR] | 63 | 3F | $?$ | 95 | 5 F | - | 127 | 7F | [DEL] |

## UTF Codes

## Unicode Transformation Format

- ASCII uses 7 bits for its codes
- This means there are $2^{7}$ (or 126) possible codes
- Preferred encoding for basic text files in the Latin alphabet
- UTF-8 is another standard
- Uses 8 bits for its codes (so, $2^{8}=256$ possibles)
- Backwards compatible with ASCII
- Preferred encoding for e-mail and web pages
- UTF-16 is the "widest" standard (uses 16 bits)
- Capable of encoding the entire Unicode repertoire.

## UTF-8 Schemes

## Functions chr (n) and ord (c)

- Characters are stored as numbers in computer memory
- There are standard codes for characters, e.g. ASCII, UTF-8, etc...
- For example, 'A' has code 65 in ASCII
- Use the ord function to verify this: ord('A') is 65
- Notice 'A' is not same as 'a': ord('a') is 97
- Every character, seen (e.g. \%, !, G, =, space, tab,...) and unseen (e.g. CONTROL-X, newline...) has an ASCII code

## Functions chr (n) and ord (c)

- Likewise, you can find character associated with a particular code using chr function, for example:

$$
\operatorname{chr}(65) \text { is } \quad \mathrm{A} \text { ' }
$$

- You can manipulate numbers in order to process characters

$$
\operatorname{chr}(\operatorname{ord}(' a ')+3) \text { is } \operatorname{chr}(97) \text {, which is } \quad d \text { ' }
$$

- Notice digit characters have codes too!

$$
\text { ord('6') is } 54
$$

## Examples

- How can I find out what's 13 letters after 'e'??
- Easy answer: recite the alphabet from ' $e$ ' and count 13 places
- Code answer: chr( ord('e') + 13 ), which is 'r'
- How can I find out what's 19 letters before ' $Z$ '??
- Code answer: chr( ord('Z') - 19), which is 'G'
- What's the ASCII code for the hashtag character??
- Code answer: ord('\#' ), which is 35

## Harder Example...

- How can I do an (not-found-in-Python) "addition" of 2 numeral strings, like ' 3 ' and ' 4 ' and get ' 7 '??
- First ask: how can I make ' 3 ' into 3? (HINT: We'll need a baseline...)
- That baseline is $\operatorname{ord}\left({ }^{\prime} 0\right.$ ')
--- how far away in the ASCII is ' 3 ' from ' 0 '???
- Note that: $\operatorname{ord}\left({ }^{\prime} 3^{\prime}\right)-\operatorname{ord}\left({ }^{\prime} 0^{\prime}\right)=3$
- So the "addition" is done like this:

$$
\begin{aligned}
& \left(\operatorname{ord}\left(3^{\prime}\right)-\operatorname{ord}\left(0^{\prime} 0^{\prime}\right)\right)+\left(\operatorname{ord}\left({ }^{\prime} 4^{\prime}\right)-\operatorname{ord}\left({ }^{\prime} 0^{\prime}\right)\right)=7 \text { (an int) } \\
& \text { or, } \quad \underline{\operatorname{ord}\left('^{\prime} 3^{\prime}\right)+\operatorname{ord}\left(4^{\prime}\right)-2^{*} \operatorname{ord}\left(0^{\prime} 0^{\prime}\right)=7}
\end{aligned}
$$

## So I Can Create a Function to do This!

```
def addChars1(char1, char2):
    numAddASCII = ord(char1) + ord(char2) - 2*ord('0')
    return numAddASCII # Returns an integer
```

## Important Caveat!

Only works with 1 character numbers!

## What if I Wanted to Return a String Result?

```
def addChars2(char1, char2):
    numAddASCII = ord(char1) + ord(char2) - 2*ord('0')
    charNum = chr(numAddASCII + ord('0'))
    return charNum # Returns a string
```

## Important Caveat!

Again, only works with 1 character numbers!

## Exercise 1

- Create a function MyCipher(myStr) - takes a string argument
- Makes every letter become the letter after it
- Letter 'a' becomes 'b', 'b' becomes 'c', etc...
- So that "hello" becomes "ifmmp" (encryption)
- How would you decrypt this?

## MyCipher() and its Reverse

```
def MyCipher(myStr):
    enc_str = ''
    for c in myStr:
        enc_str += chr(ord(c) + 1)
    return enc_str
```

```
def ReverseMyCipher(myStr):
    dec_str = ''
    for c in myStr:
        dec_str += chr(ord(c) - 1)
    return dec_str
```

## Exercise 2

Mirrored Alphabet (or "the first shall be the last")

- The letters $a, b, c, d, \ldots w, x, y, z$ map onto

$$
z, y, x, w, \ldots d, c, b, a
$$

- So that "bye" becomes "ybv"

$$
\begin{aligned}
& \text { and "maria" becomes "nzirz" } \\
& \text { and "abcdef" becomes "zyxwvu" }
\end{aligned}
$$

- How would you decrypt this?
- Would you say this is a symmetric encryption scheme?

## Mirrored Alphabet Cipher

- Let's examine the thinking behind this:

$$
\underbrace{a, b, f, g, \ldots ., w, x, y, z}_{z, y, x, w, v, u, t, \ldots ., d, c, b, a}
$$

## Our Algorithm

$a, b, c, d, e, f, g, \ldots, w, x, y, z$
$z, y, x, w, v, u, t, \ldots, d, c, b, a$

1. Given a string (message) with N number of letters
2. Go thru every letter in order to examine it
3. Apply "mapping formula" to each letter (don't know what that "formula" is yet, but that's ok...)
4. Once formula is applied,
"gather up the new letters" into a NEW string (how?)
5. Return that NEW string as the encoded message

## MirrorEncrypt()

def MirrorEncrypt(message): \# message is a string type result = '' \# start with an empty result for c in message: \# go thru every letter in message \# let’s apply the "mirror" formula:
$\mathrm{nc}=\operatorname{ord}(\mathrm{c})$
$n r=o r d(' a ')+o r d(' z ') ~-~ n c$
\# then accumulate the encoded chars, one at a time result = result + chr(nr)
return result

## MirrorEncrypt() Questions

- What happens if I try

MirrorEncrypt(MirrorEncrypt("cat"))?

- Why?
- What happens if I try

MirrorEncrypt("CAT")?

## YOUR TO-DOs

$\square$ HW7 (due on Monday, 3/11)
$\square$ HW8 (due on Wednesday, 3/13)
$\square$ Lab7 (due on Monday, 3/11)
$\square$ Project Assignment (due on Thursday, 3/14)

## </LECTURE
